Dental hygiene may be key for lupus – Oklahoma Medical Research Foundation

NOVEMBER 29, 2018

Good oral hygiene prevents cavities. Now, new research suggests it may also make a difference in preventing and managing lupus and other diseases. OMRF scientists Umesh Deshmukh, Ph.D., and Harini Bagavant, Ph.D., have found a link between gum disease and lupus, an autoimmune disease.

“Our findings suggest a simple message: If there is good dental care, patients have a good chance of experiencing less severe disease,” said Bagavant. “With further research, we might be able to tell if proper oral health has the potential to help prevent these diseases altogether.”

At OMRF, Bagavant and Deshmukh study the effect of oral health in lupus, a disease that strikes an estimated 1.5 million Americans. “Our study shows that patients who might have been exposed to gum disease-causing bacteria show higher lupus activity. Therefore, we expect that a seemingly small change, like brushing and flossing regularly, could benefit patients who are already on a host of powerful medications by allowing them to modify their treatment with fewer drugs or less powerful dosages,” she said. “And fewer drugs can mean fewer side effects.”

Gum Disease Bacteria Found in Alzheimer's Brains

Gum disease bacteria may play a role in Alzheimer's disease, researchers say.

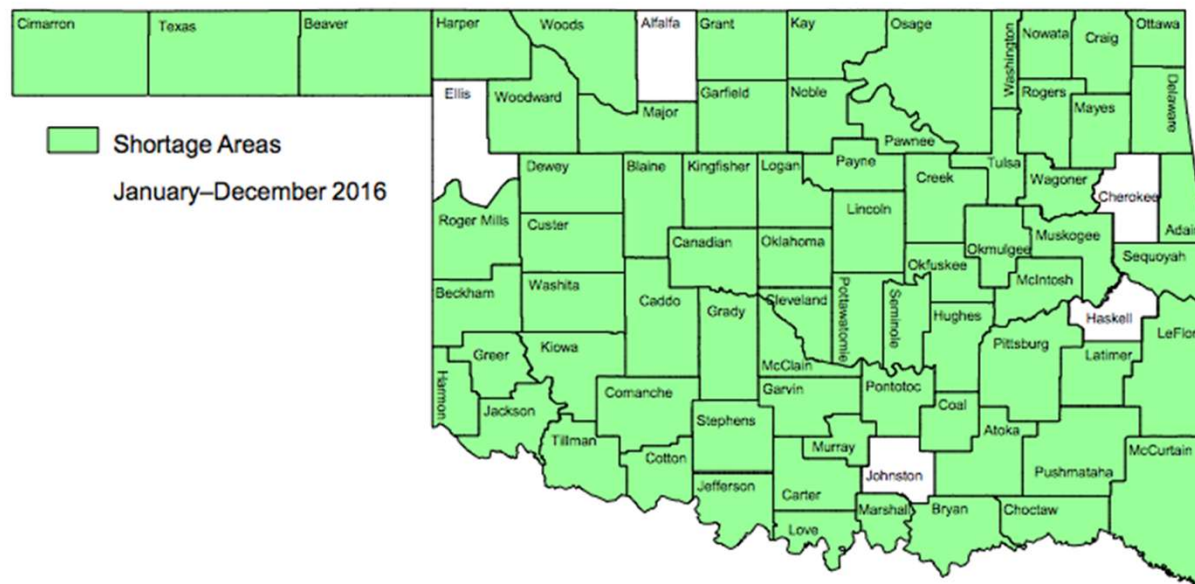

They studied dead and living patients with diagnosed and suspected Alzheimer's and found bacteria associated with chronic gum disease in the brains of people with Alzheimer's, *BBC News* reported.

Tests on mice confirmed the bacteria, *Porphyromonas gingivalis* could migrate from the mouth to the brain and that a toxic protein they secrete (gingipain) destroyed brain neurons.

The bacteria also boosted production of amyloid beta, a component of brain plaques associated with Alzheimer's, *BBC News* reported.

Further tests on mice showed that drugs that block the toxic proteins produced by the bacteria stopped brain degeneration. – January 25, 2019
